MMO Economic Board

Meeting of 26 June 2020

The 34th meeting of the MMO Economic Board took place on 26/06/2020 by video-conference, with the participation of experts from the milk supply chain: COPA-COGECA (producers and cooperatives), EMB (European Milk Board), ECVC (Via Campesina), EDA (dairy industry), Eucolait (dairy trade), Eurocommerce (retail) and CEJA (young farmers). Presentations and information exchanged during the meeting highlighted the following:

- EU-27 cow's milk collection increased in April 2020 by 0.8% (+107 000 t) compared to the same month of 2019 resulting in a cumulative increase in 2020 by +2.4%. IE, IT and NL reported the highest production growth. In 9 Member States production was lower than in April 2019, including France (-0.7%, -15000 t), likely due to voluntary reduction measures. The increase of milk collection in the first 4 months of 2020 translates into production growth for all dairy products except cream and concentrated milk. Other products: WMP (+8.3%), SMP (+1.5%), cheese (+1.4%) and butter (+0.7%). Production of drinking milk increased by a noticeable 4% in April.
- The EU average farm gate milk price is reported at 33.53 c/kg in April, which is 3.1% lower than in April 2019 but 5.1% above the last 5 years' average. Estimation for May is still above 33 c/kg but may drop more due to the fact that milk prices follow dairy market developments with a certain time lag.
- o EU butter prices fell from 368€/100kg at the beginning of the year to 281€/100kg on 10 May. In the last 5 weeks, prices have improved reaching 318 €/100kg which is still 19% lower than a year ago. EU SMP prices fell sharply from mid-March reaching 191€/100kg by mid-April, but they later improved up to levels above recent years (214€/100kg, +4% above 2019). EU cheese prices are oscillating close to last year's levels. Future developments are uncertain. The uptake of PSA for SMP, butter and cheeses has helped improving market sentiment.
- The assessment of EU stock levels based on a residual approach (EU production + EU imports EU internal consumption EU exports) shows a fluctuation of private SMP stocks around a normal level of around 120 000 t thanks to continuous exports to third countries and modest production growth. At the end of April 2020, EU butter stocks were slightly higher than a year ago due to higher initial stocks and stronger production. Also high exports to third countries helped to improve the market-balance. EU cheese stocks in total are at a normal level for this period of the year. Strong exports helped to improve the market-balance but

the collapse of food-service demand due to the lockdown and unusually strong retail demand caused distortions.

- o Global milk supply increased in the first 4 months of 2020 in the main exporting countries/regions (EU-27, US, NZ, AUS, ARG, URG) by +1.7% (rate adjusted for leap year 2020), with only negative figures for New Zealand (-1.7%) and an impressive growth in Australia where production continues to recover due to favourable weather conditions in the last few months (4.4%) and Argentina (+7.6%). In the US, milk collection plunged into negative territory in May. Volatility caused by Covid-19 has been particularly extreme in the US, enhancing uncertainty. In South America, milk production keeps recovering from 2019, especially for Argentina due to improved profitability in Q1 but lower farm gate prices in Q2 and dry weather conditions might reverse this trend. Production in Uruguay is also improving but remains below 2018 levels.
- o China, the UK and the US followed by Saudi Arabia and Algeria were the top-5 EU export markets for all dairy products in January-March 2020. The impact of Covid-19 is not yet fully visible in trade figures, as March/April volumes were already weak prior to the outbreak. Increased unemployment, lower GDP, a drop in citizens' incomes, lower oil prices, further Covid-19 outbreaks would impact the economic situation of importing countries and decrease global demand for dairy products. In addition to Covid-19, trade disputes, additional US tariffs and the final shape of post-BREXIT trade with the UK remain major concerns.
- The lockdown period caused by Covid-19 had an impact on consumption channels. In some Member States household dairy (butter, drinking milk, fresh cheeses) purchases increased compared to Q1 in 2019, partly due to at-home cooking. Sales of quality cheeses (GIs) have been negatively impacted. Sales of organic dairy products have continued to increase but at a lower rate.
- o The dairy market is in a period of uncertainty. Growing global production, trade tensions, negative macroeconomic indicators, a slow recovery of food services, etc. increase the feeling of uncertainty about the next few months. The current market balance seems fragile as supply looks set to outweigh demand in 2020. Milk output will need to adapt accordingly. Uncertainty related to the evolution of the Covid-19 pandemic and the economic downturn have an impact on the confidence of consumers as well as of dairy farmers.

Milk and Dairy Products

The EU produces approximately 150 million tonnes of raw milk each year, which makes it the world's second producer after India. Production yields per cow vary significantly depending on the farming method, but can go up to 10,000 kg annually. The EU is a major exporter of cheese and other high-value dairy products.

COPA COGECA members

Country	Summary of comments received
Finland	Production is level with last year's, prices somewhat under pressure
Ireland	Production +1-3% for 2020, milk prices may be down 10% y-o-y
Slovenia	Production will be maintained since farmers need cash, contracts will remain on same level
UK	Production under pressure because of requests by dairies, price recovery will depend very much on foodservice and drought situation
Austria	2nd half of 2020 may see further normalisation with less price actions and price reductions
Latvia	June milk price 25.67 euro per 100 kg (forecast). Production was 69m kg of milk in May.

4. Conclusion: uncertainty

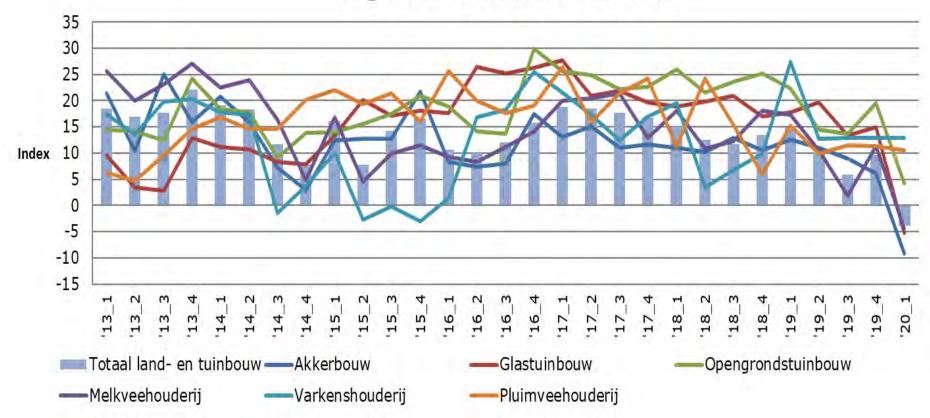

- Uncertainty re Covid-19. Economic depression: consumers lacking confidence going back to shopping & dining as before
- 2. Uncertainty in trade: Brexit, China, US, ...)
- 3. Asia's protein deficit(African Swine Fever)
- 4. Sustainability drive (Green Deal)

Plenty of uncertainty! Market direction will hinge on production response & foodservice demand. 2nd wave of COVID-19 is a threat.

5. Dutch farmers' confidence

ANNEX 4

EU dairy products monthly stock estimates at the end of April 2020

EDA

EU dairy products monthly stock estimates at the end of April 2020

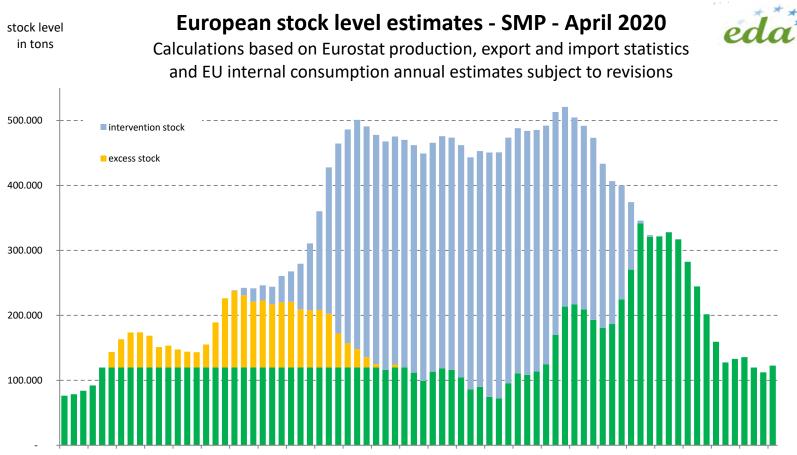

Milk Market Observatory Economic Board

June 26th, 2020

Methodology

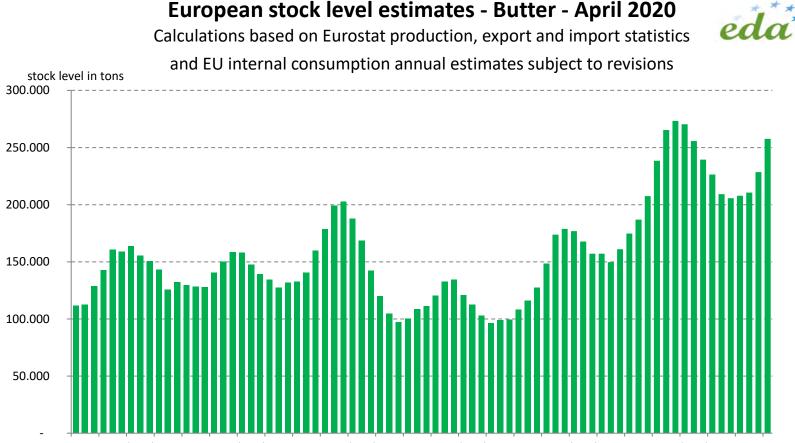

- For each dairy product and each month, the stock estimates are based on the equation:
 - Stock variation = EU production + EU import EU internal consumption EU exports
- ZMB balance sheets and forecasts have been used as references for :
 - End of year stock levels
 - Yearly consumption levels
- Monthly production statistics are based on ZMB Dairy World publications.
- Exports and imports figures are based on MMO website figures and Eurostat. Due to delays in UK-Trade figures and the transition phase calculations are still referring to EU-28.
- The initial stocks entered in the model at the beginning of 2012 are :
 - SMP: 152 000 t
 - Butter: 80 000 t
 - Cheese: 200 000 t (arbitrary basis)
- The green parts in each graph mean that this stock level can be considered as normal for the month.
- The orange part means that this stock level can be considered as too high for the month.
- These qualifications are based on the EDA analysts' personal views and past market observations.

Since the end of November 2019, the European SMP stocks are fluctuating around a normal level of around 120 000 tons, thanks to continous volumes exported to third countries and a modest production.

Jan 14Apr 14 Jul 14 Okt 14Jan 15Apr 15 Jul 15 Okt 15Jan 16Apr 16 Jul 16 Okt 16Jan 17Apr 17 Jul 17 Okt 17Jan 18Apr 18 Jul 18 Okt 18Jan 19Apr 19 Jul 19 Okt 19Jan 20Apr 20

End of April 2020, the European butter stocks are slightly higher than a year before due to higher initial stocks and stronger production. High exports to 3rd countries helped to improve the market-balance.

Jan 14Apr 14Jul 14 Okt 14Jan 15Apr 15Jul 15 Okt 15Jan 16Apr 16Jul 16 Okt 16Jan 17Apr 17Jul 17 Okt 17Jan 18Apr 18Jul 18 Okt 18Jan 19Apr 19Jul 19 Okt 19Jan 20Apr 20

End of April 2020, the European cheese stocks in total are on a normal level for the time of the year. Strong exports to 3rd countries helped to improve the market-balance. However, the collapse of food-service demand due to the lockdown and unusual strong retail-demand caused distorsions.

Calculations based on Eurostat production, export and import statistics stock level in tons and EU internal consumption annual estimates subject to revisions 550.000 _____ 500.000 _____ 450.000 400.000 350.000 300.000 250.000 200.000 150.000 100.000 50.000 0

- Conclusions

Milk production in key export regions

Comparing Jan-Apr 2020 milk production with Jan-Apr 2019 in main exporting countries/regions * (in 1000 tonnes)

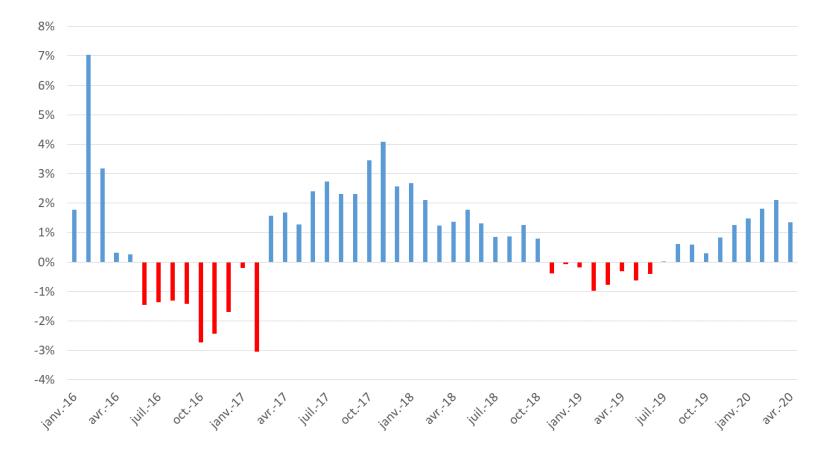

- 500

Milk production in key export regions

World milk supply 2016-2020

(EU27, US, New Zealand, Australia, Argentina, Uruguay) -% change yoy*

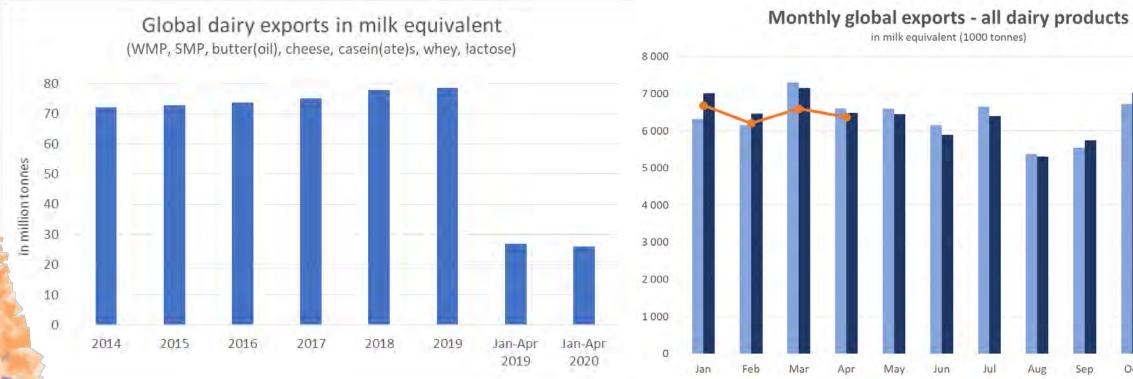

Production outlook

- EU milk collections continue to increase but the rate of growth is decreasing. Milk flows were up by 1,7% in March and 0,9% in April yoy. Outlook: dry weather conditions and efforts to reduce milk supply in some EU countries might lead to a further slowdown in the coming months and 2020 could end up on par with 2019.
- US milk collections plunged into negative territory in May (-1,1% yoy), reflecting efforts to lower production. Record milk dumping was reported in April but the volumes in question were still counted as deliveries. Volatility caused by Covid-19 has been particularly extreme in the US, enhancing uncertainty. USDA 2020 outlook +1,9%, 2021 outlook +1,3%
- NZ milk collections rebounded in May (+4,3% yoy) after 5 months of decrease caused poor weather conditions. The full season 2019/20 ended up -0,4% behind last season but up +0,7% on a milk solids basis. Outlook: slight increase as weather conditions are expected to improve in the new season.
- Australian milk production continues to recover due to favourable weather conditions in the last few months (April yoy +6,4%, season to April -1,3%). Dairy Australia outlook: -1% to -3% for the season 2019/20
- South America: milk production keeps recovering from 2019, especially for Argentina due to improved profitability in Q1 (+7,7% in April, +7,6% ytd), however lower farm gate prices in Q2 and dry weather conditions might result in a production decline. Uruguay is improving but remains below 2018 levels (+5,4% yoy, +2,6% ytd)
- **Global milk supply:** around +1% more milk expected for the whole year

Trade between EU27 and UK

Conclusions (1)

- Dairy product prices fell rapidly when the seriousness of the pandemic became clear, dropping almost to the intervention level for SMP. Price recovery has taken place since Easter, followed by stabilisation at somewhat below pre-covid levels.
- Market sentiment has improved on the back of lower milk flows and economic activity picking up again but how sustainable is this recovery?
- Food service reopening combined with still strong retail buying has sustained demand. Restaurants will however not reach normal sales before sometime in 2021 at the earliest and households will have less available income.
- The impact of covid-19 starts to be visible in trade figures and as March/April volumes were contracted prior to the outbreak, a more significant slow down could be expected from June onwards.
- All macroeconomic indicators are in the red: GDP growth, global trade volumes, employment, oil price...

Conclusions (2)

- Cheese and butter are the product categories hit hardest by covid-19 with food service accounting for 30% to 40% of the total demand in the EU. Retail demand has increased by around 20% but cannot fully compensate for the losses.
- Uptake of PSA has not been spectacular but has helped sentiment. The US food box programme has also offered considerable support to the market.
- In addition to the corona virus, US tariffs and Brexit remain major concerns.
- The current balance seems fragile as the fact remains that supply will outweigh demand in 2020. Further reduction of milk output is required.
- Are dairy markets ignoring the Covid-19 impact and the likely severe recession? **Continuous uncertainty** and volatility to be expected.
- To end on a positive note: people still have to eat and health and sustainability conscious consumers will opt for European dairy products.

ANNEX 6

Trends in sales of Milk & Dairy products – a retail perspective

EuroCommerce

TRENDS IN SALES OF MILK & DAIRY PRODUCTS – A RETAIL PERSPECTIVE Milk Market Observatory

Milk Market Observatory 26 JUNE 2020

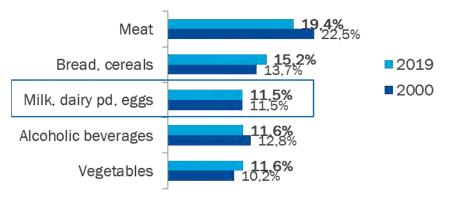

Key Figures

- The consumption of dairy products and eggs represents 21,5 billion euros in 2019 (11,5% of food expenditures) vs 11,5% in 2000 (+55%). In volume, consumption increased by 26,9% during this period.
- Long-term trends show a decline in the consumption of liquid milk and butter and an increase in demand for cheese and yoghurts.

Consumption : milk, dairy products, eggs

Breakdown of households consumption : food

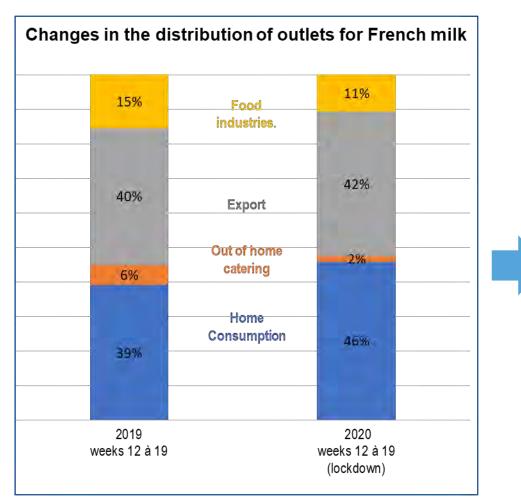

(home consumption, % value)

	2019 M€	2018-2019 value	2018-2019 volume	2000-2019 value	2000-2019 volume

Focus on fresh food in hypermarkets and supermarkets

Dairy sales in cheese counters in HM and SM have been negatively impacted by the period of containment. The sales were impacted by the closure of the cheese counters in hypermarkets and by the shift in consumption towards non-PGI or PDO cheeses.
